   break
  else
   printf "${green} Accepted ${noColor}\n"
  fi
 done
}
```

Bump allocator

```
static char buf[450 << 20];
void* operator new(size_t s) {
  static size_t i = sizeof buf; assert(s < i);
  return (void *) &buf[i -= s];
}
void operator delete(void *) {}
```

1 Data structures

1.1 DSU with rollback

```
struct Dsu {
  vi par, tot;
  stack<ii> mem;

  Dsu(int n = 1) : par(n + 1), tot(n + 1, 1) {
    iota(all(par), 0);
  }

  int find(int u) {
    return par[u] == u ? u : find(par[u]);
```

```
  }

  void unite(int u, int v) {
    u = find(u), v = find(v);
    if (u != v) {
      if (tot[u] < tot[v]) swap(u, v);
      mem.emplace(u, v);
      tot[u] += tot[v];
      par[v] = u;
    }
  }

  void rollback() {
    auto [u, v] = mem.top();
    mem.pop();
    if (u != -1) {
      tot[u] -= tot[v];
      par[v] = v;
    }
  }
};
```

1.2 Monotone queue

```
template <class T, class F = less<T>>
struct MonotoneQueue : deque<pair<T, int>> {
  F f;

  void add(T val, int pos) {
    while (this->size() && !f(this->back().f, val))
      this->pop_back();
    this->emplace_back(val, pos);
  }

  void keep(int pos) {
    while (this->size() && this->front().s < pos)
      this->pop_front();
  }

  T query() {
    return this->empty() ? 0 : this->front().f;
  }
};
```

1.3 Stack queue

```
template <class T, class F = function<T(const T&, const T&)
    >>
struct Stack : vector<T> {
  vector<T> s;
  F f;

  Stack(const F &f) : f(f) {}

  void push(T x) {
    this->pb(x);
    s.pb(s.empty() ? x : f(s.back(), x));
  }

  T pop() {
    T x = this->back();
    this->pop_back();
    s.pop_back();
    return x;
  }

  T query() {
    return s.back();
  }
};

template <class T, class F = function<T(const T&, const T&)
    >>
struct Queue {
  Stack<T> a, b;
  F f;

  Queue(const F &f) : a(f), b(f), f(f) {}

  void push(T x) {
    b.push(x);
  }

  T pop() {
    if (a.empty())
      while (!b.empty())
        a.push(b.pop());
    return a.pop();
  }

  T query() {
    if (a.empty()) return b.query();
    if (b.empty()) return a.query();
    return f(a.query(), b.query());
  }
};
```

1.4 Mo's algorithm $\mathcal{O}((N+Q)\cdot\sqrt{N}\cdot F)$

```
// N = 1e6, so aprox. sqrt(N) +/- C
const int blo = sqrt(N);
sort(all(queries), [&] (Query &a, Query &b) {
  const int ga = a.l / blo, gb = b.l / blo;
  if (ga == gb) return ga & 1 ? a.r < b.r : a.r > b.r;
  return a.l < b.l;
});

int l = queries[0].l, r = l - 1;
for (Query &q : queries) {
  while (r < q.r) add(++r);
  while (r > q.r) rem(r--);
  while (l < q.l) rem(l++);
  while (l > q.l) add(--l);
  ans[q.i] = solve();
}
```

To make it faster, change the order to $hilbert(l, r)$

```
lli hilbert(int x, int y, int pw = 21, int rot = 0) {
  if (pw == 0)
    return 0;
  int hpw = 1 << (pw - 1);
  int k = ((x < hpw ? y < hpw ? 0 : 3 : y < hpw ? 1 : 2) +
      rot) & 3;
  const int d[4] = {3, 0, 0, 1};
  lli a = 1LL << ((pw << 1) - 2);
  lli b = hilbert(x & (x ^ hpw), y & (y ^ hpw), pw - 1, (
      rot + d[k]) & 3);
  return k * a + (d[k] ? a - b - 1 : b);
}
```

1.5 Static to dynamic $\mathcal{O}(N \cdot F \cdot logN)$

```
template <class Black, class T>
struct StaticDynamic {
  Black box[LogN];
  vector<T> st[LogN];

  void insert(T &x) {
    int p = 0;
    while (p < LogN && !st[p].empty())
      p++;
    st[p].pb(x);
    fore (i, 0, p) {
      st[p].insert(st[p].end(), all(st[i]));
      box[i].clear(), st[i].clear();
```

```
    }
    for (auto y : st[p])
      box[p].insert(y);
    box[p].init();
  }
};
```

2 Intervals

2.1 Disjoint intervals

add, rem: $\mathcal{O}(logN)$

```
template <class T>
struct DisjointIntervals {
  set<pair<T, T>> st;

  void insert(T l, T r) {
    auto it = st.lower_bound({l, -1});
    if (it != st.begin() && l <= prev(it)->s)
      l = (--it)->f;
    for (; it != st.end() && it->f <= r; st.erase(it++))
      r = max(r, it->s);
    st.insert({l, r});
  }

  void erase(T l, T r) {
    auto it = st.lower_bound({l, -1});
    if (it != st.begin() && l <= prev(it)->s) --it;
    T mn = l, mx = r;
    for (; it != st.end() && it->f <= r; st.erase(it++))
      mn = min(mn, it->f), mx = max(mx, it->s);
    if (mn < l) st.insert({mn, l - 1});
    if (r < mx) st.insert({r + 1, mx});
  }
};
```

2.2 Interval tree

build: $\mathcal{O}(N \cdot logN)$, queries: $\mathcal{O}(Intervals \cdot logN)$

```
struct Interval {
  lli l, r, i;
};

struct ITree {
  ITree *left, *right;
  vector<Interval> cur;
  lli m;

  ITree(vector<Interval> &vec, lli l = LLONG_MAX, lli r =
      LLONG_MIN) : left(0), right(0) {
    if (l > r) { // not sorted yet
      sort(all(vec), [&](Interval a, Interval b) {
        return a.l < b.l;
      });
      for (auto it : vec)
        l = min(l, it.l), r = max(r, it.r);
    }
    m = (l + r) >> 1;
    vector<Interval> lo, hi;
    for (auto it : vec)
      (it.r < m ? lo : m < it.l ? hi : cur).pb(it);
    if (!lo.empty())
      left = new ITree(lo, l, m);
    if (!hi.empty())
      right = new ITree(hi, m + 1, r);
  }

  template <class F>
  void near(lli l, lli r, F f) {
    if (!cur.empty() && !(r < cur.front().l)) {
      for (auto &it : cur)
        f(it);
    }
    if (left && l <= m)
      left->near(l, r, f);
    if (right && m < r)
      right->near(l, r, f);
  }

  template <class F>
  void overlapping(lli l, lli r, F f) {
    near(l, r, [&](Interval it) {
      if (l <= it.r && it.l <= r)
        f(it);
    });
  }

  template <class F>
  void contained(lli l, lli r, F f) {
    near(l, r, [&](Interval it) {
      if (l <= it.l && it.r <= r)
        f(it);
    });
  }
};
```

3 Static range queries

3.1 Sparse table

build: $\mathcal{O}(N \cdot logN)$, query idempotent: $\mathcal{O}(1)$, normal: $\mathcal{O}(logN)$

```
template <class T, class F = function<T(const T&, const T&)
    >>
struct Sparse {
  int n;
  vector<vector<T>> sp;
  F f;

  Sparse(vector<T> &a, const F &f) : n(sz(a)), sp(1 + __lg(
      n)), f(f) {
    sp[0] = a;
    for (int k = 1; (1 << k) <= n; k++) {
      sp[k].resize(n - (1 << k) + 1);
      fore (l, 0, sz(sp[k])) {
        int r = l + (1 << (k - 1));
        sp[k][l] = f(sp[k - 1][l], sp[k - 1][r]);
      }
    }
  }

  T query(int l, int r) {
    int k = __lg(r - l + 1);
    return f(sp[k][l], sp[k][r - (1 << k) + 1]);
  }
};
```

3.2 Squirtle decomposition

build $\mathcal{O}(N \cdot \sqrt{N})$, update, query: $\mathcal{O}(\sqrt{N})$
The perfect block size is *squirtle* of N

```
int blo[N], cnt[N][B], a[N];

void update(int i, int x) {
  cnt[blo[i]][x]--;
  a[i] = x;
  cnt[blo[i]][x]++;
}

int query(int l, int r, int x) {
  int tot = 0;
```

```
  while (l <= r)
    if (l % B == 0 && l + B - 1 <= r) {
      tot += cnt[blo[l]][x];
      l += B;
    } else {
      tot += (a[l] == x);
      l++;
    }
  return tot;
}
```

3.3 Parallel binary search $\mathcal{O}((N+Q) \cdot logN \cdot F)$

```
int lo[Q], hi[Q];
queue<int> solve[N];
vector<Query> queries;

fore (it, 0, 1 + __lg(N)) {
  fore (i, 0, sz(queries))
    if (lo[i] != hi[i]) {
      int mid = (lo[i] + hi[i]) / 2;
      solve[mid].emplace(i);
    }
  fore (x, 0, n) {
    // simulate
    while (!solve[x].empty()) {
      int i = solve[x].front();
      solve[x].pop();
      if (can(queries[i]))
        hi[i] = x;
      else
        lo[i] = x + 1;
    }
  }
}
```

4 Dynamic range queries

4.1 D-dimensional Fenwick tree

```
template <class T, int ...N>
struct Fenwick {
  T v = 0;
  void update(T v) { this->v += v; }
  T query() { return v; }
};

template <class T, int N, int ...M>
struct Fenwick<T, N, M...> {
  #define lsb(x) (x & -x)
  Fenwick<T, M...> fenw[N + 1];

  template <typename... Args>
  void update(int i, Args... args) {
    for (; i <= N; i += lsb(i))
      fenw[i].update(args...);
  }

  template <typename... Args>
  T query(int l, int r, Args... args) {
    T v = 0;
    for (; r > 0; r -= lsb(r))
      v += fenw[r].query(args...);
    for (--l; l > 0; l -= lsb(l))
      v -= fenw[l].query(args...);
    return v;
  }
};
```

4.2 Dynamic segment tree

```
struct Dyn {
  int l, r;
  Dyn *left, *right;
  lli sum = 0;

  Dyn(int l, int r) : l(l), r(r), left(0), right(0) {}

  void pull() {
    sum = (left ? left->sum : 0);
    sum += (right ? right->sum : 0);
  }

  void update(int p, lli v) {
    if (l == r) {
      sum += v;
      return;
    }
    int m = (l + r) >> 1;
    if (p <= m) {
      if (!left) left = new Dyn(l, m);
      left->update(p, v);
    } else {
      if (!right) right = new Dyn(m + 1, r);
      right->update(p, v);
    }
    pull();
  }

  lli query(int ll, int rr) {
    if (rr < l || r < ll || r < l)
      return 0;
    if (ll <= l && r <= rr)
      return sum;
    int m = (l + r) >> 1;
    return (left ? left->query(ll, rr) : 0) +
           (right ? right->query(ll, rr) : 0);
  }
};
```

4.3 Persistent segment tree

```
struct Per {
  int l, r;
  Per *left, *right;
  lli sum = 0;

  Per(int l, int r) : l(l), r(r), left(0), right(0) {}

  Per* pull() {
    sum = left->sum + right->sum;
    return this;
  }

  void build() {
    if (l == r)
      return;
    int m = (l + r) >> 1;
    (left = new Per(l, m))->build();
    (right = new Per(m + 1, r))->build();
    pull();
  }

  Per* update(int p, lli v) {
    if (p < l || r < p)
      return this;
    Per* t = new Per(l, r);
    if (l == r) {
      t->sum = v;
      return t;
    }
    t->left = left->update(p, v);
    t->right = right->update(p, v);
    return t->pull();
  }
```

```
  lli query(int ll, int rr) {
    if (r < ll || rr < l)
      return 0;
    if (ll <= l && r <= rr)
      return sum;
    return left->query(ll, rr) + right->query(ll, rr);
  }
};
```

4.4 Wavelet tree

```
struct Wav {
  #define iter int* // vector<int>::iterator
  int lo, hi;
  Wav *left, *right;
  vector<int> amt;

  Wav(int lo, int hi, iter b, iter e) : lo(lo), hi(hi) { //
       array 1-indexed
    if (lo == hi || b == e)
      return;
    amt.reserve(e - b + 1);
    amt.pb(0);
    int mid = (lo + hi) >> 1;
    auto leq = [mid](int x) { return x <= mid; };
    for (auto it = b; it != e; it++)
      amt.pb(amt.back() + leq(*it));
    auto p = stable_partition(b, e, leq);
    left = new Wav(lo, mid, b, p);
    right = new Wav(mid + 1, hi, p, e);
  }

  int kth(int l, int r, int k) {
    if (r < l)
      return 0;
    if (lo == hi)
      return lo;
    if (k <= amt[r] - amt[l - 1])
      return left->kth(amt[l - 1] + 1, amt[r], k);
    return right->kth(l - amt[l - 1], r - amt[r], k - amt[r
       ] + amt[l - 1]);
  }

  int count(int l, int r, int x, int y) {
    if (r < l || y < x || y < lo || hi < x )
      return 0;
    if (x <= lo && hi <= y)
      return r - l + 1;
    return left->count(amt[l - 1] + 1, amt[r], x, y) +
           right->count(l - amt[l - 1], r - amt[r], x, y);
  }
};
```

4.5 Li Chao tree

```
struct Fun {
  lli m = 0, c = inf;
  lli operator ()(lli x) const { return m * x + c; }
};

struct LiChao {
  lli l, r;
  LiChao *left, *right;
  Fun f;

  LiChao(lli l, lli r) : l(l), r(r), left(0), right(0) {}

  void add(Fun &g) {
    if (f(l) <= g(l) && f(r) <= g(r))
      return;
    if (g(l) < f(l) && g(r) < f(r)) {
      f = g;
      return;
    }
    lli m = (l + r) >> 1;
    if (g(m) < f(m)) swap(f, g);
    if (g(l) <= f(l))
     left = left ? (left->add(g), left) : new LiChao(l, m,
         g);
    else
     right = right ? (right->add(g), right) : new LiChao(m
         + 1, r, g);
  }

  lli query(lli x) {
    if (l == r)
      return f(x);
    lli m = (l + r) >> 1;
    if (x <= m)
      return min(f(x), left ? left->query(x) : inf);
    return min(f(x), right ? right->query(x) : inf);
  }
};
```

5 Binary trees

5.1 Ordered tree

```
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;

template <class K, class V = null_type>
using ordered_tree = tree<K, V, less<K>, rb_tree_tag,
     tree_order_statistics_node_update>;
#define rank order_of_key
#define kth find_by_order
```

5.2 Unordered tree

```
struct CustomHash {
  const uint64_t C = uint64_t(2e18 * 3) + 71;
  const int R = rng();
  uint64_t operator ()(uint64_t x) const {
    return __builtin_bswap64((x ^ R) * C); }
};

template <class K, class V = null_type>
using unordered_tree = gp_hash_table<K, V, CustomHash>;
```

5.3 Treap

```
typedef struct Node* Treap;
struct Node {
  Treap left = 0, right = 0;
  unsigned pri = rng();
  int val, sz = 1;
  // define more variables here

  void push() {
    // propagate like segtree, values aren't modified!!
  }

  Treap pull() {
    #define sz(t) (t ? t->sz : 0)
    sz = 1 + sz(left) + sz(right);
    // merge(l, this), merge(this, r)
    return this;
  }

  Node(int val) : val(val) {
    pull();
  }
};

template <class F>
pair<Treap, Treap> split(Treap t, const F &leq) { // {<=
```

```
   val, > val}
  if (!t) return {t, t};
  t->push();
  if (leq(t)) {
    auto p = split(t->right, leq);
    t->right = p.f;
    return {t->pull(), p.s};
  } else {
    auto p = split(t->left, leq);
    t->left = p.s;
    return {p.f, t->pull()};
  }
}

Treap merge(Treap l, Treap r) {
  if (!l || !r) return l ? l : r;
  l->push(), r->push();
  if (l->pri > r->pri)
    return l->right = merge(l->right, r), l->pull();
  else
    return r->left = merge(l, r->left), r->pull();
}
```

5.4 Implicit treap (Rope)

```
pair<Treap, Treap> leftmost(Treap t, int k) {
  return split(t, [&](Treap t) {
    int sz = sz(t->left) + 1;
    if (k >= sz) {
      k -= sz;

      val[u] = id[x] < id[x ^ 1];
    }
    return val;
  }
};
```

6.6 Detect a cycle $\mathcal{O}(V + E)$

```cpp
bool cycle(int u) {
  vis[u] = 1;
  for (int v : graph[u]) {
    if (vis[v] == 1)
      return true;
    if (!vis[v] && cycle(v))
      return true;
  }
  vis[u] = 2;
  return false;
}
```

6.7 Euler tour for Mo's in a tree $\mathcal{O}((V + E) \cdot \sqrt{V})$

Mo's in a tree, extended euler tour tin[u] = ++timer, tout[u] = ++timer

- u = lca(u, v), query(tin[u], tin[v])
- u ≠ lca(u, v), query(tout[u], tin[v]) + query(tin[lca], tin[lca])

6.8 Isomorphism $\mathcal{O}(V + E)$

```cpp
lli f(lli x) {
  // K * n <= 9e18
  static uniform_int_distribution<lli> uid(1, K);
  if (!mp.count(x))
    mp[x] = uid(rng);
  return mp[x];
}

lli hsh(int u, int p = -1) {
  dp[u] = h[u] = 0;
  for (int v : graph[u]) {
    if (v == p)
      continue;
    dp[u] += hsh(v, u);
  }
  return h[u] = f(dp[u]);
}
```

6.9 Dynamic connectivity $\mathcal{O}((N + Q) \cdot logQ)$

```cpp
struct DynamicConnectivity {
  struct Query {
    int op, u, v, at;
  };

  Dsu dsu; // with rollback
  vector<Query> queries;
  map<ii, int> mp;
  int timer = -1;

  DynamicConnectivity(int n = 0) : dsu(n) {}

  void add(int u, int v) {
    mp[minmax(u, v)] = ++timer;
    queries.pb({'+', u, v, INT_MAX});
  }

  void rem(int u, int v) {
    int in = mp[minmax(u, v)];
    queries.pb({'-', u, v, in});
    queries[in].at = ++timer;
    mp.erase(minmax(u, v));
  }

  void query() {
    queries.push_back({'?', -1, -1, ++timer});
  }

  void solve(int l, int r) {
    if (l == r) {
      if (queries[l].op == '?') // solve the query here
      return;
    }

    int before = sz(dsu.mem);
    for (int i = m + 1; i <= r; i++) {
      Query &q = queries[i];
      if (q.op == '-' && q.at < l)
        dsu.unite(q.u, q.v);
    }
    solve(l, m);
    while (sz(dsu.mem) > before)
      dsu.rollback();
    for (int i = l; i <= m; i++) {
      Query &q = queries[i];
      if (q.op == '+' && q.at > r)
        dsu.unite(q.u, q.v);
    }
    solve(m + 1, r);
    while (sz(dsu.mem) > before)
      dsu.rollback();
  }
};
```

7 Tree queries

7.1 Lowest common ancestor (LCA)

build: $\mathcal{O}(N \cdot logN)$, query: $\mathcal{O}(logN)$

```
const int LogN = 1 + __lg(N);
int par[LogN][N], dep[N];

void dfs(int u, int par[]) {
  for (int v : graph[u])
    if (v != par[u]) {
      par[v] = u;
      dep[v] = dep[u] + 1;
      dfs(v, par);
    }
}

int lca(int u, int v){
  if (dep[u] > dep[v])
    swap(u, v);
  fore (k, LogN, 0)
    if (dep[v] - dep[u] >= (1 << k))
      v = par[k][v];
  if (u == v)
    return u;
  fore (k, LogN, 0)
    if (par[k][v] != par[k][u])
      u = par[k][u], v = par[k][v];
  return par[0][u];
}

int dist(int u, int v) {
  return dep[u] + dep[v] - 2 * dep[lca(u, v)];
}

void init(int r) {
  dfs(r, par[0]);
  fore (k, 1, LogN)
    fore (u, 1, n + 1)
      par[k][u] = par[k - 1][par[k - 1][u]];
}
```

7.2 Virtual tree

build: $\mathcal{O}(Ver \cdot logN)$

```
vector<int> virt[N];

int virtualTree(vector<int> &ver) {
  auto byDfs = [&](int u, int v) {
    return tin[u] < tin[v];
  };
  sort(all(ver), byDfs);
  fore (i, sz(ver), 1)
    ver.pb(lca(ver[i - 1], ver[i]));
  sort(all(ver), byDfs);
  ver.erase(unique(all(ver)), ver.end());
  for (int u : ver)
    virt[u].clear();
  fore (i, 1, sz(ver))
    virt[lca(ver[i - 1], ver[i])].pb(ver[i]);
  return ver[0];
}
```

7.3 Guni

Solve subtrees problems $\mathcal{O}(N \cdot logN \cdot F)$

```
int cnt[C], color[N];
int sz[N];

int guni(int u, int p = -1) {
  sz[u] = 1;
  for (int &v : graph[u]) if (v != p) {
    sz[u] += guni(v, u);
    if (sz[v] > sz[graph[u][0]] || p == graph[u][0])
      swap(v, graph[u][0]);
  }
  return sz[u];
}

void add(int u, int p, int x, bool skip) {
  cnt[color[u]] += x;
  for (int i = skip; i < sz(graph[u]); i++) // don't change
      it with a fore!!!
    if (graph[u][i] != p)
      add(graph[u][i], u, x, 0);
}

void solve(int u, int p = -1, bool keep = 0) {
  fore (i, sz(graph[u]), 0)
    if (graph[u][i] != p)
      solve(graph[u][i], u, !i);
  add(u, p, +1, 1); // add
  // now cnt[i] has how many times the color i appears in
      the subtree of u
  if (!keep) add(u, p, -1, 0); // remove
}
```

7.4 Centroid decomposition

Solves "all pairs of nodes" problems $\mathcal{O}(N \cdot logN \cdot F)$

```
int cdp[N], sz[N];
bitset<N> rem;

int dfsz(int u, int p = -1) {
  sz[u] = 1;
  for (int v : graph[u])
    if (v != p && !rem[v])
      sz[u] += dfsz(v, u);
  return sz[u];
}

int centroid(int u, int n, int p = -1) {
  for (int v : graph[u])
    if (v != p && !rem[v] && 2 * sz[v] > n)
      return centroid(v, n, u);
  return u;
}

void solve(int u, int p = -1) {
  cdp[u = centroid(u, dfsz(u))] = p;
  rem[u] = true;
  for (int v : graph[u])
    if (!rem[v])
      solve(v, u);
}
```

7.5 Heavy-light decomposition

Solves subtrees and paths problems $\mathcal{O}(N \cdot logN \cdot F)$

```
int par[N], nxt[N], dep[N], sz[N];
int tin[N], tout[N], who[N], timer = 0;
Lazy *tree;

int dfs(int u) {
  for (auto &v : graph[u]) if (v != par[u]) {
    par[v] = u;
    dep[v] = dep[u] + 1;
    sz[u] += dfs(v);
    if (graph[u][0] == par[u] || sz[v] > sz[graph[u][0]])
      swap(v, graph[u][0]);
  }
  return sz[u];
}
```

```
void hld(int u) {
  tin[u] = ++timer;
  who[timer] = u;
  for (auto &v : graph[u]) if (v != par[u]) {
    nxt[v] = (v == graph[u][0] ? nxt[u] : v);
    hld(v);
  }
  tout[u] = timer;
}

template <class F>
void processPath(int u, int v, F f) {
  for (; nxt[u] != nxt[v]; u = par[nxt[u]]) {
    if (dep[nxt[u]] < dep[nxt[v]]) swap(u, v);
    f(tin[nxt[u]], tin[u]);
  }
  if (dep[u] < dep[v]) swap(u, v);
  f(tin[v] + overEdges, tin[u]); // overEdges???
}

void updatePath(int u, int v, lli z) {
  processPath(u, v, [&](int l, int r) {
    tree->update(l, r, z);
  });
}

void updateSubtree(int u, lli z) {
  tree->update(tin[u], tout[u], z);
}

lli queryPath(int u, int v) {
  lli sum = 0;
  processPath(u, v, [&](int l, int r) {
    sum += tree->query(l, r);
  });
  return sum;
}

lli querySubtree(int u) {
  return tree->query(tin[u], tout[u]);
}

int lca(int u, int v) {
  int last = -1;
  processPath(u, v, [&](int l, int r) {
    last = who[l];
  });
  return last;
}
```

7.6 Link-Cut tree

Solves dynamic trees problems, can handle subtrees and paths maybe with a high constant $\mathcal{O}(N \cdot logN \cdot F)$

```
typedef struct Node* Splay;
struct Node {
  Splay left = 0, right = 0, par = 0;
  bool rev = 0;
  int sz = 1;

```

10.6 Divide and conquer $\mathcal{O}(kn^2) \Rightarrow \mathcal{O}(k \cdot nlogn)$

Split the array of size n into k continuous groups. $k \leq n$
$cost(a,c) + cost(b,d) \leq cost(a,d) + cost(b,c)$ with $a \leq b \leq c \leq d$

```
void solve(int cut, int l, int r, int optl, int optr) {
  if (r < l)
    return;
  int mid = (l + r) / 2;
  pair<lli, int> best = {inf, -1};
  fore (p, optl, min(mid, optr) + 1)
    best = min(best, {dp[~cut & 1][p - 1] + cost(p, mid), p
        });
  dp[cut & 1][mid] = best.f;
  solve(cut, l, mid - 1, optl, best.s);
  solve(cut, mid + 1, r, best.s, optr);
}

fore (i, 1, n + 1)
  dp[1][i] = cost(1, i);
fore (cut, 2, k + 1)
  solve(cut, cut, n, cut, n);
```

10.7 Knuth optimization $\mathcal{O}(n^3) \Rightarrow \mathcal{O}(n^2)$

$dp[l][r] = \min_{l \leq k \leq r}\{dp[l][k] + dp[k][r]\} + cost(l,r)$

```
fore (len, 1, n + 1)
  fore (l, 0, n) {
    int r = l + len - 1;
    if (r > n - 1)
      break;
    if (len <= 2) {
      dp[l][r] = 0;
      opt[l][r] = l;
      continue;
    }
    dp[l][r] = inf;
    fore (k, opt[l][r - 1], opt[l + 1][r] + 1) {
      lli cur = dp[l][k] + dp[k][r] + cost(l, r);
      if (cur < dp[l][r]) {
        dp[l][r] = cur;
        opt[l][r] = k;
      }
    }
  }
```

11 Game Theory

11.1 Grundy Numbers

If the moves are consecutive $S = \{1, 2, 3, ..., x\}$ the game can be solved like $stackSize \pmod{x+1} \neq 0$

```
int mem[N];

int mex(set<int> &st) {
  int x = 0;
  while (st.count(x))
    x++;
  return x;
}

int grundy(int n) {
  if (n < 0)
    return inf;
  if (n == 0)
    return 0;
  int &g = mem[n];
  if (g == -1) {
    set<int> st;
    for (int x : {a, b})
      st.insert(grundy(n - x));
    g = mex(st);
  }
  return g;
}
```

12	479,001,600	208,012
13	6,227,020,800	742,900

12.1 Factorial

```
void factorial(int n) {
  fac[0] = 1LL;
  fore (i, 1, n)
    fac[i] = lli(i) * fac[i - 1] % mod;
  ifac[n - 1] = fpow(fac[n - 1], mod - 2);
  fore (i, n - 1, 0)
    ifac[i] = lli(i + 1) * ifac[i + 1] % mod;
}
```

12.2 Factorial mod $smallPrime$

```
lli facMod(lli n, int p) {
  lli r = 1LL;
  for (; n > 1; n /= p) {
    r = (r * ((n / p) % 2 ? p - 1: 1)) % p;
    fore (i, 2, n % p + 1)
      r = r * i % p;
  }
  return r % p;
}
```

12.3 Lucas theorem

Changes $\binom{n}{k}$ mod p, with $n \geq 2e6, k \geq 2e6$ and $p \leq 1e7$

$$\binom{n}{k} \equiv \prod_{i=0}^{n} \binom{n_i}{k_i} \bmod p$$

```
lli lucas(lli n, lli k) {
  if (k == 0)
    return 1LL;
  return lucas(n / mod, k / mod) * choose(n % mod, k % mod)
       % mod;
}
```

12.4 Stars and bars

Enclosing n objects in k boxes

$$\binom{n+k-1}{k-1} = \binom{n+k-1}{n}$$

12.5 N choose K

$$\binom{n}{k} = \binom{n-1}{k-1} + \binom{n-1}{k}$$

$$\binom{n}{k_1, k_2, ..., k_m} = \frac{n!}{k_1! * k_2! * ... * k_m!}$$

```
lli choose(int n, int k) {
  if (n < 0 || k < 0 || n < k)
    return 0LL;
  return fac[n] * ifac[k] % mod * ifac[n - k] % mod;
}
```

```
lli choose(int n, int k) {
  double r = 1;
  fore (i, 1, k + 1)
    r = r * (n - k + i) / i;
  return lli(r + 0.01);
}
```

12.6 Catalan

```
catalan[0] = 1LL;
fore (i, 0, N) {
  catalan[i + 1] = catalan[i] * lli(4 * i + 2) % mod * fpow
      (i + 2, mod - 2) % mod;
}
```

12.7 Burnside's lemma

$$|classes| = \frac{1}{|G|} \cdot \sum_{x \in G} f(x)$$

12.8 Prime factors of N!

```
vector< pair<lli, int> > factorialFactors(lli n) {
  vector< pair<lli, int> > fac;
  for (lli p : primes) {
    if (n < p)
      break;
    lli mul = 1LL, k = 0;
    while (mul <= n / p) {
      mul *= p;
      k += n / mul;
    }
    fac.emplace_back(p, k);
  }
  return fac;
}
```

13 Number Theory

13.1 Goldbach conjecture

- All number ≥ 6 can be written as sum of 3 *primes*
- All even number > 2 can be written as sum of 2 *primes*

13.2 Prime numbers distribution

Amount of primes approximately $\frac{n}{\ln(n)}$

13.3 Sieve of Eratosthenes $\mathcal{O}(N \cdot log(logN))$

To factorize divide x by $factor[x]$ until is equal to 1

```
void factorizeSieve() {
  iota(factor, factor + N, 0);
  for (int i = 2; i * i < N; i++) if (factor[i] == i)
    for (int j = i * i; j < N; j += i)
      factor[j] = i;
}

map<int, int> factorize(int n) {
  map<int, int> cnt;
  while (n > 1) {
    cnt[factor[n]]++;
    n /= factor[n];
  }
  return cnt;
}
```

Use it if you need a huge amount of $phi[x]$ up to some N

```
void phiSieve() {
  isPrime.set();
  iota(phi, phi + N, 0);
  fore (i, 2, N) if (isPrime[i])
    for (int j = i; j < N; j += i) {
```

```
      isPrime[j] = (i == j);
      phi[j] = phi[j] / i * (i - 1);
    }
}
```

13.4 Phi of euler $\mathcal{O}(\sqrt{N})$

```
lli phi(lli n) {
  if (n == 1) return 0;
  lli r = n;
  for (lli i = 2; i * i <= n; i++)
    if (n % i == 0) {
      while (n % i == 0) n /= i;
      r -= r / i;
    }
  if (n > 1) r -= r / n;
  return r;
}
```

13.5 Miller-Rabin $\mathcal{O}(Witnesses \cdot (logN)^3)$

```
bool miller(lli n) {
  if (n < 2 || n % 6 % 4 != 1)
    return (n | 1) == 3;
  int k = __builtin_ctzll(n - 1);
  lli d = n >> k;
  auto compo = [&](lli p) {
    lli x = fpow(p % n, d, n), i = k;
    while (x != 1 && x != n - 1 && p % n && i--)
      x = mul(x, x, n);
    return x != n - 1 && i != k;
  };
  for (lli p : {2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37
      }) {
    if (compo(p)) return 0;
    if (compo(2 + rng() % (n - 3))) return 0;
  }
  return 1;
}
```

13.6 Pollard-Rho $\mathcal{O}(N^{1/4})$

```
lli rho(lli n) {
  while (1) {
    lli x = 2 + rng() % (n - 3), c = 1 + rng() % 20;
    auto f = [&](lli x) { return (mul(x, x, n) + c) % n; };
    lli y = f(x), g;
    while ((g = __gcd(n + y - x, n)) == 1)
      x = f(x), y = f(f(y));
    if (g != n) return g;
  }
  return -1;
}

void pollard(lli n, map<lli, int> &fac) {
  if (n == 1) return;
  if (n % 2 == 0) {
    fac[2]++;
    pollard(n / 2, fac);
    return;
  }
  if (miller(n)) {
    fac[n]++;
    return;
  }
  lli x = rho(n);
  pollard(x, fac);
  pollard(n / x, fac);
}
```

13.7 Amount of divisors $\mathcal{O}(N^{1/3})$

```
lli amountOfDivisors(lli n) {
  lli cnt = 1LL;
  for (int p : primes) {
    if (1LL * p * p * p > n) break;
    if (n % p == 0) {
      lli k = 0;
      while (n > 1 && n % p == 0) n /= p, ++k;
      cnt *= (k + 1);
    }
  }
  lli sq = mysqrt(n); // A binary search, the last x * x <=
      n
  if (miller(n)) cnt *= 2;
  else if (sq * sq == n && miller(sq)) cnt *= 3;
  else if (n > 1) cnt *= 4;
  return cnt;
}
```

13.8 Bézout's identity

$a_1 * x_1 + a_2 * x_2 + ... + a_n * x_n = g$
$g = \gcd(a_1, a_2, ..., a_n)$

13.9 GCD

$a \leq b; \gcd(a+k, b+k) = \gcd(b-a, a+k)$

13.10 LCM

$x = p * lcm(a_1, a_2, ..., a_k) + q, 0 \leq q \leq lcm(a_1, a_2, ..., a_k)$
$x \pmod{a_i} \equiv q \pmod{a_i}$ as $a_i \mid lcm(a_1, a_2, ..., a_k)$

13.11 Euclid $\mathcal{O}(log(a \cdot b))$

```
pair<lli, lli> euclid(lli a, lli b) {
  if (b == 0)
    return {1, 0};
  auto p = euclid(b, a % b);
  return {p.s, p.f - a / b * p.s};
}
```

13.12 Chinese remainder theorem

```
pair<lli, lli> crt(pair<lli,lli> a, pair<lli,lli> b) {
  if (a.s < b.s) swap(a, b);
  auto p = euclid(a.s, b.s);
  lli g = a.s * p.f + b.s * p.s, l = a.s / g * b.s;
  if ((b.f - a.f) % g != 0)
    return {-1, -1}; // no solution
  p.f = a.f + (b.f - a.f) % b.s * p.f % b.s / g * a.s;
  return {p.f + (p.f < 0) * l, l};
}
```

14 Math

14.1 Progressions

Arithmetic progressions

$a_n = a_1 + (n-1) * diff$
$\sum_{i=1}^{n} a_i = n * \frac{a_1 + a_n}{2}$

Geometric progressions

$a_n = a_1 * r^{n-1}$
$\sum_{k=1}^{n} a_1 * r^k = a_1 * \left(\frac{r^{n+1}-1}{r-1}\right) : r \neq 1$

14.2 Fpow

```
template <class T>
T fpow(T x, lli n) {
  T r(1);
  for (; n > 0; n >>= 1) {
    if (n & 1) r = r * x;
    x = x * x;
  }
  return r;
}
```

14.3 Fibonacci

$$\begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}^n = \begin{bmatrix} fib_{n+1} & fib_n \\ fib_n & fib_{n-1} \end{bmatrix}$$

15 Bit tricks

Bits++	
Operations on *int*	Function
`x & -x`	Least significant bit in x
`__lg(x)`	Most significant bit in x
`c = x&-x, r = x+c; (((r^x) » 2)/c) | r`	Next number after x with same number of bits set
__builtin_	Function
popcount(x)	Amount of 1's in x
clz(x)	0's to the **left** of biggest bit
ctz(x)	0's to the **right** of smallest bit

15.1 Bitset

Bitset<Size>	
Operation	Function
_Find_first()	Least significant bit
_Find_next(idx)	First set bit after index *idx*
any(), none(), all()	Just what the expression says
set(), reset(), flip()	Just what the expression says x2
to_string('.', 'A')	Print 011010 like .AA.A.

16 Geometry 222

```
