2 Dynamic programming **7**
2.1 All submasks of a mask . . . 7
2.2 Broken profile $\mathcal{O}(n \cdot m \cdot 2^n)$ with $n \leq m$ . . . 7
2.3 Convex hull trick $\mathcal{O}(n^2) \Rightarrow \mathcal{O}(n)$ . . . 8
2.4 Digit dp . . . 8
2.5 Divide and conquer $\mathcal{O}(k \cdot n^2) \Rightarrow \mathcal{O}(k \cdot nlogn)$ . . . 8
2.6 Knapsack 01 $\mathcal{O}(n \cdot MaxW)$ . . . 8
2.7 Knuth $\mathcal{O}(n^3) \Rightarrow \mathcal{O}(n^2)$ . . . 9
2.8 Matrix exponentiation $\mathcal{O}(n^3 \cdot logn)$ . . . 9
2.9 SOS dp . . . 9
2.10 Inverse SOS dp . . . 9

3 Geometry **9**
3.1 Geometry . . . 9
3.2 Radial order . . . 9
3.3 Sort along line . . . 9

4 Point **9**
4.1 Point . . . 9
4.2 Angle between vectors . . . 10
4.3 Closest pair of points $\mathcal{O}(n \cdot logn)$ . . . 10
4.4 KD Tree . . . 10

5 Lines and segments **11**
5.1 Line . . . 11
5.2 Segment . . . 11
5.3 Projection . . . 11
5.4 Distance point line . . . 11
5.5 Distance point segment . . . 11
5.6 Distance segment segment . . . 11

6 Circle **11**
6.1 Circle . . . 11
6.2 Distance point circle . . . 12
6.3 Common area circle circle . . . 12
6.4 Minimum enclosing circle $\mathcal{O}(n)$ wow!! . . . 12

7 Polygon **12**
7.1 Area polygon . . . 12
7.2 Perimeter . . . 12
7.3 Cut polygon line . . . 12
7.4 Common area circle polygon $\mathcal{O}(n)$ . . . 12
7.5 Point in polygon . . . 13
7.6 Convex hull $\mathcal{O}(nlogn)$ . . . 13
7.7 Is convex . . . 13
7.8 Point in convex polygon $\mathcal{O}(logn)$ . . . 13

8 Graphs **13**
8.1 Cycle . . . 13
8.2 Cutpoints and bridges . . . 13
8.3 Tarjan . . . 13
8.4 Isomorphism . . . 14
8.5 Two sat $\mathcal{O}(2 \cdot n)$ . . . 14
8.6 LCA . . . 14
8.7 Virtual tree $\mathcal{O}(n \cdot logn)$ "lca tree" . . . 14
8.8 Euler-tour + HLD + LCA $\mathcal{O}(n \cdot logn)$ . . . 15
8.9 Centroid $\mathcal{O}(n \cdot logn)$ . . . 15
8.10 Guni $\mathcal{O}(n \cdot logn)$ . . . 15
8.11 Link-Cut tree $\mathcal{O}(n \cdot logn)$ . . . 16

9 Flows **17**
9.1 Blossom $\mathcal{O}(n^3)$ . . . 17
9.2 Hopcroft Karp $\mathcal{O}(e\sqrt{v})$ . . . 18
9.3 Hungarian $\mathcal{O}(n^2 \cdot m)$ . . . 18
9.4 Dinic $\mathcal{O}(\min(e \cdot flow, v^2 \cdot e))$ . . . 19

1 Data structures

1.1 DSU rollback

```
struct Dsu {
  vector<int> par, tot;
  stack<ii> mem;

  Dsu(int n = 1) : par(n + 1), tot(n + 1, 1) {
    iota(all(par), 0);
  }

  int find(int u) {
    return par[u] == u ? u : find(par[u]);
  }

  void unite(int u, int v) {
    u = find(u), v = find(v);
    if (u != v) {
      if (tot[u] < tot[v])
        swap(u, v);
      mem.emplace(u, v);
      tot[u] += tot[v];
      par[v] = u;
    } else {
      mem.emplace(-1, -1);
    }
  }

  void rollback() {
    auto [u, v] = mem.top();
    mem.pop();
    if (u != -1) {
      tot[u] -= tot[v];
      par[v] = v;
    }
  }
};
```

1.2 Monotone queue $\mathcal{O}(n)$

```
// MonotoneQueue<int, greater<int>> = Max-MonotoneQueue

template <class T, class F = less<T>>
struct MonotoneQueue {
  deque<pair<T, int>> q;
  F f;

  void add(int pos, T val) {
    while (q.size() && !f(q.back().f, val))
      q.pop_back();
    q.emplace_back(val, pos);
  }

  void trim(int pos) { // >= pos
    while (q.size() && q.front().s < pos)
      q.pop_front();
  }

  T query() {
    return q.empty() ? T() : q.front().f;
  }
};
```

1.3 Stack queue $\mathcal{O}(n)$

```
template <class T, class F = function<T(const T&, const T&)
    >>
struct Stack : vector<T> {
  vector<T> s;
  F f;

  Stack(const F& f) : f(f) {}

  void push(T x) {
    this->pb(x);
    s.pb(s.empty() ? x : f(s.back(), x));
  }

  T pop() {
    T x = this->back();
    this->pop_back();
    s.pop_back();
    return x;
  }

  T query() {
    return s.back();
  }
};

template <class T, class F = function<T(const T&, const T&)
    >>
struct Queue {
  Stack<T> a, b;
  F f;

  Queue(const F& f) : a(f), b(f), f(f) {}

  void push(T x) {
    b.push(x);
  }

  T pop() {
    if (a.empty())
      while (!b.empty())
        a.push(b.pop());
    return a.pop();
  }

  T query() {
    if (a.empty())
      return b.query();
    if (b.empty())
      return a.query();
    return f(a.query(), b.query());
  }
};
```

1.4 In-Out trick

```
vector<int> in[N], out[N];
vector<Query> queries;

fore (x, 0, N) {
  for (int i : in[x])
    add(queries[i]);
  // solve
  for (int i : out[x])
    rem(queries[i]);
}
```

1.5 Parallel binary search $\mathcal{O}((n+q) \cdot logn)$

Hay q queries, n updates, se pide encontrar cuándo se cumple cierta condición con un prefijo de updates.

```
int lo[QUERIES], hi[QUERIES];
queue<int> solve[UPDATES];
vector<Update> updates;
vector<Query> queries;

fore (it, 0, 1 + __lg(UPDATES)) {
  fore (i, 0, sz(queries))
```

```
    if (lo[i] != hi[i]) {
      int mid = (lo[i] + hi[i]) / 2;
      solve[mid].emplace(i);
    }
  fore (i, 0, sz(updates)) {
    // add the i-th update, we have a prefix of updates
    while (!solve[i].empty()) {
      int qi = solve[i].front();
      solve[i].pop();
      if (can(queries[qi]))
        hi[qi] = i;
      else
        lo[qi] = i + 1;
    }
  }
}
```

1.6 Mos $\mathcal{O}((n+q)\cdot\sqrt{n})$

Mo's in a tree, extended euler tour tin[u] = ++timer, tout[u] = ++timer

- u = lca(u, v), query(tin[u], tin[v])
- u ≠ lca(u, v), query(tout[u], tin[v]) + query(tin[lca], tin[lca])

```
struct Query {
  int l, r, i;
};

vector<Query> queries;

const int BLOCK = sqrt(N);
sort(all(queries), [&](Query& a, Query& b) {
  const int ga = a.l / BLOCK, gb = b.l / BLOCK;
  if (ga == gb)
    return a.r < b.r;
  return ga < gb;
});

int l = queries[0].l, r = l - 1;
for (auto& q : queries) {
  while (r < q.r)
    add(++r);
  while (r > q.r)
    rem(r--);
  while (l < q.l)
    rem(l++);
  while (l > q.l)
    add(--l);
  ans[q.i] = solve();
}
```

1.7 Hilbert order

```
struct Query {
  int l, r, i;
  lli order = hilbert(l, r);
}
lli hilbert(int x, int y, int pw = 21, int rot = 0) {
  if (pw == 0)
    return 0;
  int hpw = 1 << (pw - 1);
  int k = ((x < hpw ? y < hpw ? 0 : 3 : y < hpw ? 1 : 2) +
      rot) & 3;
  const int d[4] = {3, 0, 0, 1};
  lli a = 1LL << ((pw << 1) - 2);
  lli b = hilbert(x & (x ^ hpw), y & (y ^ hpw), pw - 1, (
      rot + d[k]) & 3);
  return k * a + (d[k] ? a - b - 1 : b);
}
```

1.8 Sqrt decomposition

```
const int BLOCK = sqrt(N);
int blo[N]; // blo[i] = i / BLOCK

void update(int i) {}

int query(int l, int r) {
  while (l <= r)
    if (l % BLOCK == 0 && l + BLOCK - 1 <= r) {
      // solve for block
      l += BLOCK;
    } else {
      // solve for individual element
      l++;
    }
}
```

1.9 Sparse table

```
template <class T, class F = function<T(const T&, const T&)
    >>
struct Sparse {
  vector<T> sp[21]; // n <= 2^21
  F f;
  int n;

  Sparse(T* begin, T* end, const F& f) : Sparse(vector<T>(
      begin, end), f) {}

  Sparse(const vector<T>& a, const F& f) : f(f), n(sz(a)) {
    sp[0] = a;
    for (int k = 1; (1 << k) <= n; k++) {
      sp[k].resize(n - (1 << k) + 1);
      fore (l, 0, sz(sp[k])) {
        int r = l + (1 << (k - 1));
        sp[k][l] = f(sp[k - 1][l], sp[k - 1][r]);
      }
    }
  }

  T query(int l, int r) {
#warning Can give TLE D:, change it to a log table
    int k = __lg(r - l + 1);
    return f(sp[k][l], sp[k][r - (1 << k) + 1]);
  }
};
```

1.10 Fenwick

```
template <class T>
struct Fenwick {
  vector<T> fenw;

  Fenwick(int n) : fenw(n, T()) {} // 0-indexed

  void update(int i, T v) {
    for (; i < sz(fenw); i |= i + 1)
      fenw[i] += v;
  }

  T query(int i) {
    T v = T();
    for (; i >= 0; i &= i + 1, --i)
      v += fenw[i];
    return v;
  }

  // First position such that fenwick's sum >= v
  int lower_bound(T v) {
```

```
    int pos = 0;
    for (int k = __lg(sz(fenw)); k >= 0; k--)
      if (pos + (1 << k) <= sz(fenw) && fenw[pos + (1 << k)
            - 1] < v) {
        pos += (1 << k);
        v -= fenw[pos - 1];
      }
    return pos + (v == 0);
  }
};
```

1.11 Fenwick 2D offline

```
template <class T>
struct Fenwick2D { // add, build then update, query
  vector<vector<T>> fenw;
  vector<vector<int>> ys;
  vector<int> xs;
  vector<ii> pts;

  void add(int x, int y) {
    pts.pb({x, y});
  }

  void build() {
    sort(all(pts));
    for (auto&& [x, y] : pts) {
      if (xs.empty() || x != xs.back())
        xs.pb(x);
      swap(x, y);
    }
    fenw.resize(sz(xs)), ys.resize(sz(xs));
    sort(all(pts));
    for (auto&& [x, y] : pts) {
      swap(x, y);
      int i = lower_bound(all(xs), x) - xs.begin();
      for (; i < sz(fenw); i |= i + 1)
        if (ys[i].empty() || y != ys[i].back())

2 Dynamic programming

2.1 All submasks of a mask

```
for (int B = A; B > 0; B = (B - 1) & A)
```

2.2 Broken profile $\mathcal{O}(n \cdot m \cdot 2^n)$ with $n \leq m$

Cuenta todas las maneras en las que puedes acomodar fichas de 1x2 y 2x1 en un tablero $n \cdot m$

```
// Answer in dp[m][0][0]

lli dp[2][N][1 << N];

dp[0][0][0] = 1;

fore (c, 0, m) {
  fore (r, 0, n + 1)
    fore (mask, 0, 1 << n) {
      if (r == n) {
```

```
        dp[~c & 1][0][mask] += dp[c & 1][r][mask];
        continue;
      }

      if (~(mask >> r) & 1) {
        dp[c & 1][r + 1][mask | (1 << r)] += dp[c & 1][r][
            mask];

        if (~(mask >> (r + 1)) & 1)
          dp[c & 1][r + 2][mask] += dp[c & 1][r][mask];
      } else {
        dp[c & 1][r + 1][mask & ~(1 << r)] += dp[c & 1][r][
            mask];
      }
    }

  fore (r, 0, n + 1)
    fore (mask, 0, 1 << n)
      dp[c & 1][r][mask] = 0;
}
```

2.3 Convex hull trick $\mathcal{O}(n^2) \Rightarrow \mathcal{O}(n)$

$dp[i] = \min_{j<i}(dp[j] + b[j] * a[i])$
$dp[i][j] = \min_{k<j}(dp[i-1][k] + b[k] * a[j])$
$b[j] \geq b[j+1]$ optionally $a[i] \leq a[i+1]$

```
// for doubles, use INF = 1/.0, div(a,b) = a / b
struct Line {
  mutable lli m, c, p;
  bool operator<(const Line& l) const {
    return m < l.m;
  }
  bool operator<(lli x) const {
    return p < x;
  }
  lli operator()(lli x) const {
    return m * x + c;
  }
};

template <bool MAX>
struct DynamicHull : multiset<Line, less<>> {
  lli div(lli a, lli b) {
    return a / b - ((a ^ b) < 0 && a % b);
  }

  bool isect(iterator i, iterator j) {

    else
      i->p = div(i->c - j->c, j->m - i->m);
    return i->p >= j->p;
  }

  void add(lli m, lli c) {
    if (!MAX)
      m = -m, c = -c;
    auto k = insert({m, c, 0}), j = k++, i = j;
    while (isect(j, k))
      k = erase(k);
    if (i != begin() && isect(--i, j))
      isect(i, j = erase(j));
    while ((j = i) != begin() && (--i)->p >= j->p)
      isect(i, erase(j));
  }

  lli query(lli x) {
    if (empty())
      return 0LL;
    auto f = *lower_bound(x);
    return MAX ? f(x) : -f(x);
  }
};
```

2.4 Digit dp

Counts the amount of numbers in $[l, r]$ such are divisible by k. (flag *nonzero* is for different lengths)
It can be reduced to $dp(i, x, small)$, and has to be solved like $f(r) - f(l-1)$

```
#define state [i][x][small][big][nonzero]
int dp(int i, int x, bool small, bool big, bool nonzero) {
  if (i == sz(r))
    return x % k == 0 && nonzero;
  int& ans = mem state;
  if (done state != timer) {
    done state = timer;
    ans = 0;
    int lo = small ? 0 : l[i] - '0';
    int hi = big ? 9 : r[i] - '0';
    fore (y, lo, max(lo, hi) + 1) {
      bool small2 = small | (y > lo);
      bool big2 = big | (y < hi);
      bool nonzero2 = nonzero | (x > 0);
      ans += dp(i + 1, (x * 10 + y) % k, small2, big2,
          nonzero2);
    }
  }
  return ans;
}
```

2.5 Divide and conquer $\mathcal{O}(k \cdot n^2) \Rightarrow \mathcal{O}(k \cdot nlogn)$

Split the array of size n into k continuous groups. $k \leq n$
$cost(a, c) + cost(b, d) \leq cost(a, d) + cost(b, c)$ with $a \leq b \leq c \leq d$

```
lli dp[2][N];

void solve(int cut, int l, int r, int optl, int optr) {
  if (r < l)
    return;
  int mid = (l + r) / 2;
  pair<lli, int> best = {INF, -1};
  fore (p, optl, min(mid, optr) + 1)
    best = min(best, {dp[~cut & 1][p - 1] + cost(p, mid), p
        });
  dp[cut & 1][mid] = best.f;
  solve(cut, l, mid - 1, optl, best.s);
  solve(cut, mid + 1, r, best.s, optr);
}

fore (i, 1, n + 1)
  dp[1][i] = cost(1, i);
fore (cut, 2, k + 1)
  solve(cut, cut, n, cut, n);
```

2.6 Knapsack 01 $\mathcal{O}(n \cdot MaxW)$

```
fore (i, 0, n)
  for (int x = MaxW; x >= w[i]; x--)
    umax(dp[x], dp[x - w[i]] + cost[i]);
```

2.7 Knuth $\mathcal{O}(n^3) \Rightarrow \mathcal{O}(n^2)$

$dp[l][r] = \min_{l \le k \le r}\{dp[l][k] + dp[k][r]\} + cost(l, r)$

```
lli dp[N][N];
int opt[N][N];

fore (len, 1, n + 1)
  fore (l, 0, n) {
    int r = l + len - 1;
    if (r > n - 1)
      break;
    if (len <= 2) {
      dp[l][r] = 0;
      opt[l][r] = l;
      continue;
    }
    dp[l][r] = INF;
    fore (k, opt[l][r - 1], opt[l + 1][r] + 1) {
      lli cur = dp[l][k] + dp[k][r] + cost(l, r);
      if (cur < dp[l][r]) {

```

```
    }
    return make_pair(cost, flow);
  }
};
```

10 Game theory

10.1 Grundy numbers

If the moves are consecutive $S = \{1, 2, 3, ..., x\}$ the game can be solved like $stackSize \pmod{x+1} \neq 0$

```
int mem[N];

int mex(set<int>& st) {
  int x = 0;
  while (st.count(x))
    x++;
  return x;
}

int grundy(int n) {
  if (n < 0)
    return INF;
  if (n == 0)
    return 0;
  int& g = mem[n];
  if (g == -1) {
    set<int> st;
    for (int x : {a, b})
      st.insert(grundy(n - x));
    g = mex(st);
  }
  return g;
}
```

11 Math

11.1 Bits

Bits++	
Operations on *int*	Function
`x & -x`	Least significant bit in x
`__lg(x)`	Most significant bit in x
`c = x&-x, r = x+c; (((r^x) » 2)/c) | r`	Next number after x with same number of bits set
__builtin_	Function
popcount(x)	Amount of 1's in x
clz(x)	0's to the **left** of biggest bit
ctz(x)	0's to the **right** of smallest bit

11.2 Bitset

Bitset<Size>	
Operation	Function
_Find_first()	Least significant bit
_Find_next(idx)	First set bit after index *idx*
any(), none(), all()	Just what the expression says
set(), reset(), flip()	Just what the expression says x2
to_string('.', 'A')	Print 011010 like .AA.A.

11.3 Gauss jordan $\mathcal{O}(n^2 \cdot m)$

```
template <class T>
pair<int, vector<T>> gauss(vector<vector<T>> a, vector<T> b
    ) {
  const double eps = 1e-6;
  int n = a.size(), m = a[0].size();
  for (int i = 0; i < n; i++)
    a[i].push_back(b[i]);
  vector<int> where(m, -1);
  for (int col = 0, row = 0; col < m and row < n; col++) {
    int sel = row;
    for (int i = row; i < n; ++i)
      if (abs(a[i][col]) > abs(a[sel][col]))
        sel = i;
    if (abs(a[sel][col]) < eps)
      continue;
    for (int i = col; i <= m; i++)
      swap(a[sel][i], a[row][i]);
    where[col] = row;

    for (int i = 0; i < n; i++)
      if (i != row) {
        T c = a[i][col] / a[row][col];
        for (int j = col; j <= m; j++)
          a[i][j] -= a[row][j] * c;
      }
    row++;
  }
  vector<T> ans(m, 0);
  for (int i = 0; i < m; i++)
    if (where[i] != -1)
      ans[i] = a[where[i]][m] / a[where[i]][i];
  for (int i = 0; i < n; i++) {
    T sum = 0;
    for (int j = 0; j < m; j++)
      sum += ans[j] * a[i][j];
    if (abs(sum - a[i][m]) > eps)
      return pair(0, vector<T>());
  }
  for (int i = 0; i < m; i++)
    if (where[i] == -1)
      return pair(INF, ans);
  return pair(1, ans);
}
```

11.4 Modular

```
template <const int M>
struct Modular {
  int v;
  Modular(int a = 0) : v(a) {}
  Modular(lli a) : v(a % M) {
    if (v < 0)
      v += M;
  }

  Modular operator+(Modular m) {
    return Modular((v + m.v) % M);
  }

  Modular operator-(Modular m) {
    return Modular((v - m.v + M) % M);
  }

  Modular operator*(Modular m) {
    return Modular((1LL * v * m.v) % M);
  }

  Modular inv() {
    return this->pow(M - 2);
  }

  Modular operator/(Modular m) {
    return *this * m.inv();
  }

  Modular& operator+=(Modular m) {
```

```
    return *this = *this + m;
  }

  Modular& operator-=(Modular m) {
    return *this = *this - m;
  }

  Modular& operator*=(Modular m) {
    return *this = *this * m;
  }

  Modular& operator/=(Modular m) {
    return *this = *this / m;
  }

  friend ostream& operator<<(ostream& os, Modular m) {
    return os << m.v;
  }

  Modular pow(lli n) {
    Modular r(1), x = *this;
    for (; n > 0; n >>= 1) {
      if (n & 1)
        r = r * x;
      x = x * x;
    }
    return r;
  }
};
```

11.5 Probability

Conditional

The event A happens and the event B has already happened

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

If **independent** events

$$P(A|B) = P(A), P(B|A) = P(B)$$

Bayes theorem

$$P(A|B) = \frac{P(B|A) \cdot P(A)}{P(B)}$$

Binomial

$$B = \binom{n}{x} \cdot p^x \cdot (1-p)^{n-x}$$

n = number of trials
x = number of **success** from n trials
p = probability of **success** on a single trial

Geometric

Probability of success at the nth-event after failing the others

$$G = (1-p)^{n-1} \cdot p$$

n = number of trials
p = probability of *success* on a single trial

Poisson

$$Po = \frac{\lambda^k \cdot e^{-\lambda}}{k!}$$

λ = number of times an event is expected (occurs / time)
k = number of occurring events in the limited period of time

Example: The event happens 4 times per minute and we want k events to happen in 10 minutes, then $\lambda = 4 \cdot 10 = 40$

Expected value

$$E_x = \sum_{\forall x} x \cdot p(x)$$

11.6 Simplex

Simplex is used for solving system of linear inequalities

Maximize/Minimize $f(x, y) = 3x + 2y$; all variables are ≥ 0

- $2x + y \leq 18$
- $2x + 3y \leq 42$
- $3x + y \leq 24$

$ans = 33, x = 3, y = 12$

$$a = \begin{bmatrix} 2 & 1 \\ 2 & 3 \\ 3 & 1 \end{bmatrix} \quad \text{b} = [18,\ 42,\ 24] \quad \text{c} = [3,\ 2]$$

```
template <class T>
pair<T, vector<T>> simplex(vector<vector<T>> a, vector<T> b
    , vector<T> c) {
  const T EPS = 1e-9;
  T sum = 0;

15.10 Suffix automaton $\mathcal{O}(\sum s_i)$

- $sam[u].len - sam[sam[u].link].len =$ distinct strings
- Number of different substrings (dp) $\mathcal{O}(\sum s_i)$

$$diff(u) = 1 + \sum_{v \in trie[u]} diff(v)$$

- Total length of all different substrings (2 x dp)

$$totLen(u) = \sum_{v \in trie[u]} diff(v) + totLen(v)$$

- Leftmost occurrence $\mathcal{O}(|s|)$ $trie[u].pos = trie[u].len - 1$ if it is **clone** then $trie[clone].pos = trie[q].pos$
- All occurrence positions
- Smallest cyclic shift $\mathcal{O}(|2 * s|)$ Construct sam of $s + s$, find the lexicographically smallest path of $sz(s)$
- Shortest non-appearing string $\mathcal{O}(|s|)$

$$nonAppearing(u) = \min_{v \in trie[u]} nonAppearing(v) + 1$$
