    else
      printf "${green} Accepted ${noColor}\n"
    fi
  done
}
```

Bump allocator

```
static char buf[450 << 20];
void* operator new(size_t s) {
  static size_t i = sizeof buf; assert(s < i);
  return (void *) &buf[i -= s];
}
void operator delete(void *) {}
```

1 Data structures

1.1 Disjoint set with rollback

```
struct Dsu {
  vi pr, tot;
  stack<ii> mem;

  Dsu(int n = 0) : pr(++n), tot(n, 1) {
    iota(all(pr), 0);
  }

  int find(int u) {
    return pr[u] == u ? u : find(pr[u]);
  }

  void unite(int u, int v) {
    u = find(u), v = find(v);
    if (u != v) {
      if (tot[u] < tot[v])
        swap(u, v);
      mem.emplace(u, v);
      tot[u] += tot[v];
      pr[v] = u;
    }
  }

  void rollback() {
    auto [u, v] = mem.top();
    mem.pop();
    if (u != -1) {
      tot[u] -= tot[v];
      pr[v] = v;
    }
  }
};
```

1.2 Min-Max queue

```
template <class T>
struct MinQueue : deque< pair<T, int> > {
  // add a element to the right {val, pos}
  void add(T val, int pos) {
    while (!empty() && back().f >= val)
      pop_back();
    emplace_back(val, pos);
  }
  // remove all less than pos
  void rem(int pos) {
    while (front().s < pos)
      pop_front();
  }
  T qmin() { return front().f; }
};
```

1.3 Sparse table

```
template <class T, class F = function<T(const T&,
    const T&)>>
struct Sparse {
  int n;
  vector<vector<T>> sp;
  F f;

  Sparse(vector<T> &a, const F &f) : n(sz(a)), sp(1 +
      __lg(n)), f(f) {
    sp[0] = a;
    for (int k = 1; (1 << k) <= n; k++) {
      sp[k].resize(n - (1 << k) + 1);
      fore (l, 0, sz(sp[k])) {
        int r = l + (1 << (k - 1));
        sp[k][l] = f(sp[k - 1][l], sp[k - 1][r]);
      }
    }
  }

  T query(int l, int r) {
    int k = __lg(r - l + 1);
    return f(sp[k][l], sp[k][r - (1 << k) + 1]);
  }
};
```

1.4 Squirtle decomposition

The perfect block size is *squirtle* of N

```
int blo[N], cnt[N][B], a[N];

void update(int i, int x) {
  cnt[blo[i]][x]--;
  a[i] = x;
  cnt[blo[i]][x]++;
}

int query(int l, int r, int x) {
  int tot = 0;
  while (l <= r)
    if (l % B == 0 && l + B - 1 <= r) {
      tot += cnt[blo[l]][x];
      l += B;
    } else {
      tot += (a[l] == x);
      l++;
    }
  return tot;
}
```

1.5 In-Out trick

```
vector<int> in[N], out[N];
vector<Query> queries;

fore (x, 0, N) {
  for (int i : in[x])
    add(queries[i]);
  // solve
  for (int i : out[x])
    rem(queries[i]);
}
```

1.6 Parallel binary search

```
int lo[Q], hi[Q];
queue<int> solve[N];
vector<Query> queries;
```

```
fore (it, 0, 1 + __lg(N)) {
  fore (i, 0, sz(queries))
    if (lo[i] != hi[i]) {
      int mid = (lo[i] + hi[i]) / 2;
      solve[mid].emplace(i);
    }
  fore (x, 0, n) {
    // simulate
    while (!solve[x].empty()) {
      int i = solve[x].front();
      solve[x].pop();
      if (can(queries[i]))
        hi[i] = x;
      else
        lo[i] = x + 1;
    }
  }
}
```

1.7 Mo's algorithm

```
vector<Query> queries;
// N = 1e6, so aprox. sqrt(N) +/- C
uniform_int_distribution<int> dis(970, 1030);
const int blo = dis(rng);
sort(all(queries), [&](Query a, Query b) {
  const int ga = a.l / blo, gb = b.l / blo;
  if (ga == gb)
    return (ga & 1) ? a.r < b.r : a.r > b.r;
  return a.l < b.l;
});
int l = queries[0].l, r = l - 1;
for (Query &q : queries) {
  while (r < q.r)
    add(++r);
  while (r > q.r)
    rem(r--);
  while (l < q.l)
    rem(l++);
  while (l > q.l)
    add(--l);
  ans[q.i] = solve();
}
```

To make it faster, change the order to $hilbert(l, r)$

```
lli hilbert(int x, int y, int pw = 21, int rot = 0) {
  if (pw == 0)
    return 0;
  int hpw = 1 << (pw - 1);
  int k = ((x < hpw ? y < hpw ? 0 : 3 : y < hpw ? 1 :
      2) + rot) & 3;
  const int d[4] = {3, 0, 0, 1};
  lli a = 1LL << ((pw << 1) - 2);
  lli b = hilbert(x & (x ^ hpw), y & (y ^ hpw), pw - 1
      , (rot + d[k]) & 3);
  return k * a + (d[k] ? a - b - 1 : b);
}
```

Mo's algorithm with updates in $\mathcal{O}(n^{\frac{5}{3}})$

- Choose a *block* of size $n^{\frac{2}{3}}$
- Do a normal Mo's algorithm, in the *Query* definition add an extra variable for the *updatesSoFar*
- Sort the queries by the order ($l/block$, $r/block$, $updatesSoFar$)
- If the update lies inside the current query, update the data structure properly

```
struct Update {
  int pos, prv, nxt;
};
```

```
void undo(Update &u) {
  if (l <= u.pos && u.pos <= r) {
    rem(u.pos);
    a[u.pos] = u.prv;
    add(u.pos);
  } else {
    a[u.pos] = u.prv;
  }
}
```

- Solve the problem :D

```
l = queries[0].l, r = l - 1, upd = sz(updates) - 1;
for (Query &q : queries) {
  while (upd < q.upd)
    dodo(updates[++upd]);
  while (upd > q.upd)
    undo(updates[upd--]);
  // write down the normal Mo's algorithm
}
```

1.8 Static to dynamic

```
template <class Black, class T>
struct StaticDynamic {
  Black box[LogN];
  vector<T> st[LogN];

  void insert(T &x) {
    int p = 0;
    fore (i, 0, LogN)
      if (st[i].empty()) {
        p = i;
        break;
      }
    st[p].pb(x);
    fore (i, 0, p) {
      st[p].insert(st[p].end(), all(st[i]));
      box[i].clear(), st[i].clear();
    }
    for (auto y : st[p])
      box[p].insert(y);
    box[p].init();
  }
};
```

1.9 Disjoint intervals

```
struct Range {
  int l, r;
  bool operator < (const Range& rge) const {
    return l < rge.l;
  }
};

struct DisjointIntervals : set<Range> {
  void add(Range rge) {
    iterator p = lower_bound(rge), q = p;
    if (p != begin() && rge.l <= (--p)->r)
      rge.l = p->l, --q;
    for (; q != end() && q->l <= rge.r; erase(q++))
      rge.r = max(rge.r, q->r);
    insert(rge);
  }

  void add(int l, int r) {
    add(Range{l, r});
  }
};
```

1.10 Ordered tree

```
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;
```

```cpp
template <class K, class V = null_type>
using ordered_tree = tree<K, V, less<K>, rb_tree_tag,
     tree_order_statistics_node_update>;
// less_equal<K> for multiset, multimap (?
#define qrank order_of_key
#define qkth find_by_order
```

1.11 Unordered tree

```cpp
struct chash {
  const uint64_t C = uint64_t(2e18 * 3) + 71;
  const int R = rng();
  uint64_t operator ()(uint64_t x) const {
    return __builtin_bswap64((x ^ R) * C); }
};

template <class K, class V = null_type>
using unordered_tree = gp_hash_table<K, V, chash>;
```

1.12 D-dimensional Fenwick tree

```cpp
template <class T, int ...N>
struct Fenwick {
  T v = 0;
  void update(T v) { this->v += v; }
  T query() { return v; }
};

template <class T, int N, int ...M>
struct Fenwick<T, N, M...> {
  #define lsb(x) (x & -x)
  Fenwick<T, M...> fenw[N + 1];

  template <typename... Args>
  void update(int i, Args... args) {
    for (; i <= N; i += lsb(i))
      fenw[i].update(args...);
  }

  template <typename... Args>
  T query(int l, int r, Args... args) {
    T v = 0;
    for (; r > 0; r -= lsb(r))
      v += fenw[r].query(args...);
    for (--l; l > 0; l -= lsb(l))
      v -= fenw[l].query(args...);
    return v;
  }
};
```

1.13 Dynamic segment tree

```cpp
struct Dyn {
  int l, r;
  lli sum = 0;
  Dyn *ls, *rs;

  Dyn(int l, int r) : l(l), r(r), ls(0), rs(0) {}

  void pull() {
    sum = (ls ? ls->sum : 0);
    sum += (rs ? rs->sum : 0);
  }

  void update(int p, lli v) {
    if (l == r) {
      sum += v;
      return;
    }
    int m = (l + r) >> 1;
    if (p <= m) {
      if (!ls) ls = new Dyn(l, m);
      ls->update(p, v);
    } else {
      if (!rs) rs = new Dyn(m + 1, r);
      rs->update(p, v);
    }
    pull();
  }

  lli qsum(int ll, int rr) {
    if (rr < l || r < ll || r < l)
      return 0;
    if (ll <= l && r <= rr)
      return sum;
    int m = (l + r) >> 1;
    return (ls ? ls->qsum(ll, rr) : 0) +
           (rs ? rs->qsum(ll, rr) : 0);
  }
};
```

1.14 Persistent segment tree

```cpp
struct Per {
  int l, r;
  lli sum = 0;
  Per *ls, *rs;

  Per(int l, int r) : l(l), r(r), ls(0), ls(0) {}

  Per* pull() {
    sum = ls->sum + rs->sum;
    return this;
  }

  void build() {
    if (l == r)
      return;
    int m = (l + r) >> 1;
    (ls = new Per(l, m))->build();
    (rs = new Per(m + 1, r))->build();
    pull();
  }

  Per* update(int p, lli v) {
    if (p < l || r < p)
      return this;
    Per* t = new Per(l, r);
    if (l == r) {
      t->sum = v;
      return t;
    }
    t->ls = ls->update(p, v);
    t->rs = rs->update(p, v);
    return t->pull();
  }

  lli qsum(int ll, int rr) {
    if (r < ll || rr < l)
      return 0;
    if (ll <= l && r <= rr)
      return sum;
    return ls->qsum(ll, rr) + rs->qsum(ll, rr);
  }
};
```

1.15 Wavelet tree

```cpp
struct Wav {
  #define iter int* // vector<int>::iterator
  int lo, hi;
  Wav *ls, *rs;
  vi amt;

  Wav(int lo, int hi) : lo(lo), hi(hi), ls(0), rs(0)
```

```
    {}

  void build(iter b, iter e) { // array 1-indexed
    if (lo == hi || b == e)
      return;
    amt.reserve(e - b + 1);
    amt.pb(0);
    int m = (lo + hi) >> 1;
    for (auto it = b; it != e; it++)
      amt.pb(amt.back() + (*it <= m));
    auto p = stable_partition(b, e, [&](int x) {
      return x <= m;
    });
    (ls = new Wav(lo, m))->build(b, p);
    (rs = new Wav(m + 1, hi))->build(p, e);
  }

  int qkth(int l, int r, int k) {
    if (r < l)
      return 0;
    if (lo == hi)
      return lo;
    if (k <= amt[r] - amt[l - 1])
      return ls->qkth(amt[l - 1] + 1, amt[r], k);
    return rs->qkth(l - amt[l - 1], r - amt[r], k -
        amt[r] + amt[l - 1]);
  }

5 Dynamic Programming

5.1 Matrix Chain Multiplication

```
int dp(int l, int r) {
  if (l > r)
    return 0LL;
  int &ans = mem[l][r];
  if (!done[l][r]) {
    done[l][r] = true, ans = inf;
    fore (k, l, r + 1) // split in [l, k] [k + 1, r]
      ans = min(ans, dp(l, k) + dp(k + 1, r) + add);
  }
  return ans;
}
```

5.2 Digit DP

Counts the amount of numbers in $[l, r]$ such are divisible by k. (flag *nonzero* is for different lengths)
It can be reduced to $dp(i, x, small)$, and has to be solve like $f(r) - f(l-1)$

```
#define state [i][x][small][big][nonzero]
int dp(int i, int x, bool small, bool big, bool
    nonzero) {
  if (i == sz(r))
    return x % k == 0 && nonzero;
  int &ans = mem state;
  if (done state != timer) {
    done state = timer;
    ans = 0;
    int lo = small ? 0 : l[i] - '0';
    int hi = big ? 9 : r[i] - '0';
    fore (y, lo, max(lo, hi) + 1) {
      bool small2 = small | (y > lo);
      bool big2 = big | (y < hi);
      bool nonzero2 = nonzero | (x > 0);
      ans += dp(i + 1, (x * 10 + y) % k, small2, big2,
           nonzero2);
    }
  }
  return ans;
}
```

5.3 Knapsack 0/1

```
for (auto &cur : items)
  fore (w, W + 1, cur.w) // [cur.w, W]
    umax(dp[w], dp[w - cur.w] + cur.cost);
```

5.4 Convex Hull Trick $\mathcal{O}(n^2) \Rightarrow \mathcal{O}(n)$

$dp[i] = \min_{j<i}(dp[j] + b[j] * a[i])$
$dp[i][j] = \min_{k<j}(dp[i-1][k] + b[k] * a[j])$
$b[j] \geq b[j+1]$ optionally $a[i] \leq a[i+1]$

```
// for doubles, use inf = 1/.0, div(a,b) = a / b
struct Line {
  mutable lli m, c, p;
  bool operator < (const Line &l) const { return m < l
      .m; }
  bool operator < (lli x) const { return p < x; }
  lli operator ()(lli x) const { return m * x + c; }
};

struct DynamicHull : multiset<Line, less<>> {

5.5 Divide and conquer $\mathcal{O}(kn^2) \Rightarrow \mathcal{O}(k \cdot nlogn)$

Split the array of size n into k continuous groups. $k \leq n$
$cost(a,c) + cost(b,d) \leq cost(a,d) + cost(b,c)$ with $a \leq b \leq c \leq d$

```
void dc(int cut, int l, int r, int optl, int optr) {
  if (r < l)
    return;
  int mid = (l + r) / 2;
  pair<lli, int> best = {inf, -1};
  fore (p, optl, min(mid, optr) + 1) {
    lli nxt = dp[~cut & 1][p - 1] + cost(p, mid);
    if (nxt < best.f)
      best = {nxt, p};
  }
  dp[cut & 1][mid] = best.f;
  int opt = best.s;
  dc(cut, l, mid - 1, optl, opt);
  dc(cut, mid + 1, r, opt, optr);
}

fore (i, 1, n + 1)
  dp[1][i] = cost(1, i);
fore (cut, 2, k + 1)
  dc(cut, cut, n, cut, n);
```

5.6 Knuth optimization $\mathcal{O}(n^3) \Rightarrow \mathcal{O}(n^2)$

$dp[l][r] = \min_{l \le k \le r}\{dp[l][k] + dp[k][r]\} + cost(l, r)$

```
fore (len, 1, n + 1)
  fore (l, 0, n) {
    int r = l + len - 1;
    if (r > n - 1)
      break;
    if (len <= 2) {
      dp[l][r] = 0;

      continue;
    }
    dp[l][r] = inf;
    fore (k, opt[l][r - 1], opt[l + 1][r] + 1) {
      lli cur = dp[l][k] + dp[k][r] + cost(l, r);
      if (cur < dp[l][r]) {
        dp[l][r] = cur;
        opt[l][r] = k;
      }
    }
  }
```

5.7 Do all submasks of a mask

```
for (int B = A; B > 0; B = (B - 1) & A)
```

6 Game Theory

6.1 Grundy Numbers

If the moves are consecutive $S = \{1, 2, 3, ..., x\}$ the game can be solved like $stackSize \pmod{x+1} \neq 0$

```
int mem[N];

int mex(set<int> &st) {
  int x = 0;
  while (st.count(x))
    x++;
  return x;
}

int grundy(int n) {
  if (n < 0)
    return inf;
  if (n == 0)
    return 0;
  int &g = mem[n];
  if (g == -1) {
    set<int> st;
    for (int x : {a, b})
      st.insert(grundy(n - x));
    g = mex(st);
  }
  return g;
}
```

7 Combinatorics

Combinatorics table		
Number	Factorial	Catalan
0	1	1
1	1	1
2	2	2

10	3,628,800	16,796
11	39,916,800	58,786
12	479,001,600	208,012
13	6,227,020,800	742,900

7.1 Factorial

```
fac[0] = 1LL;
fore (i, 1, N)
  fac[i] = lli(i) * fac[i - 1] % mod;
ifac[N - 1] = fpow(fac[N - 1], mod - 2);
fore (i, N - 1, 0)
  ifac[i] = lli(i + 1) * ifac[i + 1] % mod;
```

7.2 Factorial mod $smallPrime$

```
lli facMod(lli n, int p) {
  lli r = 1LL;
  for (; n > 1; n /= p) {
    r = (r * ((n / p) % 2 ? p - 1: 1)) % p;
    fore (i, 2, n % p + 1)
      r = r * i % p;
  }
  return r % p;
}
```

7.3 Lucas theorem

Changes $\binom{n}{k} \bmod p$, with $n \geq 2e6, k \geq 2e6$ and $p \leq 1e7$

$$\binom{n}{k} \equiv \prod_{i=0}^{n} \binom{n_i}{k_i} \bmod p$$

7.4 Stars and bars

Enclosing n objects in k boxes

$$\binom{n+k-1}{k-1} = \binom{n+k-1}{n}$$

7.5 N choose K

$$\binom{n}{k} = \binom{n-1}{k-1} + \binom{n-1}{k}$$

$$\binom{n}{k_1, k_2, ..., k_m} = \frac{n!}{k_1! * k_2! * ... * k_m!}$$

```
lli choose(int n, int k) {
  if (n < 0 || k < 0 || n < k)
    return 0LL;
  return fac[n] * ifac[k] % mod * ifac[n - k] % mod;
}

lli choose(int n, int k) {
  double r = 1;
  fore (i, 1, k + 1)
    r = r * (n - k + i) / i;
  return lli(r + 0.01);
}
```

7.6 Catalan

```
catalan[0] = 1LL;
fore (i, 0, N) {
  catalan[i + 1] = catalan[i] * lli(4 * i + 2) % mod *
       fpow(i + 2, mod - 2) % mod;
}
```

7.7 Burnside's lemma

$$|classes| = \frac{1}{|G|} \cdot \sum_{x \in G} f(x)$$

7.8 Prime factors of N!

```
vector< pair<lli, int> > factorialFactors(lli n) {
  vector< pair<lli, int> > fac;
  for (lli p : primes) {
    if (n < p)
      break;
    lli mul = 1LL, k = 0;
    while (mul <= n / p) {
      mul *= p;
      k += n / mul;
    }
    fac.emplace_back(p, k);
  }
  return fac;
}
```

8 Number Theory

8.1 Goldbach conjecture

- All number ≥ 6 can be written as sum of 3 *primes*
- All even number > 2 can be written as sum of 2 *primes*

8.2 Sieve of Eratosthenes

Numbers up to $2e8$

```
int erat[N >> 6];
#define bit(i) ((i >> 1) & 31)
#define prime(i) !(erat[i >> 6] >> bit(i) & 1)

void bitSieve() {
  for (int i = 3; i * i < N; i += 2) if (prime(i))
    for (int j = i * i; j < N; j += (i << 1))
      erat[j >> 6] |= 1 << bit(j);
}
```

To factorize divide x by $factor[x]$ until is equal to 1

```
void factorizeSieve() {
  iota(factor, factor + N, 0);
  for (int i = 2; i * i < N; i++) if (factor[i] == i)
    for (int j = i * i; j < N; j += i)
      factor[j] = i;
}
```

Use it if you need a huge amount of $phi[x]$ up to some N

```
void phiSieve() {
  isp.set(); // bitset<N> is faster
  iota(phi, phi + N, 0);
  fore (i, 2, N) if (isp[i])
    for (int j = i; j < N; j += i) {
      isp[j] = (i == j);
      phi[j] /= i;
      phi[j] *= i - 1;
    }
}
```

8.3 Phi of euler

```
lli phi(lli n) {
  if (n == 1)
    return 0;
  lli r = n;
  for (lli i = 2; i * i <= n; i++)
    if (n % i == 0) {
      while (n % i == 0)
        n /= i;
      r -= r / i;
    }
  if (n > 1)
    r -= r / n;
  return r;
}
```

8.4 Miller-Rabin

```
bool compo(lli p, lli d, lli n, lli k) {
  lli x = fpow(p % n, d, n), i = k;
  while (x != 1 && x != n - 1 && p % n && i--)
    x = mul(x, x, n);
  return x != n - 1 && i != k;
}

bool miller(lli n) {
  if (n < 2 || n % 6 % 4 != 1)
    return (n | 1) == 3;
  int k = __builtin_ctzll(n - 1);
  lli d = n >> k;
  for (lli p : {2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31
      , 37}) {
    if (compo(p, d, n, k))
      return 0;
    if (compo(2 + rng() % (n - 3), d, n, k))
      return 0;
  }
  return 1;
}
```

8.5 Pollard-Rho

```
lli f(lli x, lli c, lli mod) {
  return (mul(x, x, mod) + c) % mod;
}

lli rho(lli n) {
  while (1) {
    lli x = 2 + rng() % (n - 3), c = 1 + rng() % 20, y
        = f(x, c, n), g;
    while ((g = __gcd(n + y - x, n)) == 1)
      x = f(x, c, n), y = f(f(y, c, n), c, n);
    if (g != n) return g;
  }
  return -1;
}

void pollard(lli n, map<lli, int> &fac) {
  if (n == 1) return;
  if (n % 2 == 0) {
    fac[2]++;
    pollard(n / 2, fac);
    return;
  }
  if (miller(n)) {
    fac[n]++;
    return;
  }
  lli x = rho(n);
  pollard(x, fac);
  pollard(n / x, fac);
}
```

8.6 Amount of divisors

```
lli divs(lli n) {
  lli cnt = 1LL;
  for (lli p : primes) {
    if (p * p * p > n)
```

```
      break;
    if (n % p == 0) {
      lli k = 0;
      while (n > 1 && n % p == 0)
        n /= p, ++k;
      cnt *= (k + 1);
    }
  }
  lli sq = mysqrt(n); // A binary search, the last x *
      x <= n
  if (miller(n))
    cnt *= 2;
  else if (sq * sq == n && miller(sq))
    cnt *= 3;
  else if (n > 1)
    cnt *= 4;
  return cnt;
}
```

8.7 Bézout's identity

$a_1 * x_1 + a_2 * x_2 + ... + a_n * x_n = g$
$g = \gcd(a_1, a_2, ..., a_n)$

8.8 GCD

$a \leq b; \gcd(a+k, b+k) = \gcd(b-a, a+k)$

8.9 LCM

$x = p * lcm(a_1, a_2, ..., a_k) + q, 0 \leq q \leq lcm(a_1, a_2, ..., a_k)$
$x \pmod{a_i} \equiv q \pmod{a_i}$ as $a_i \mid lcm(a_1, a_2, ..., a_k)$

8.10 Euclid

```
pair<lli, lli> euclid(lli a, lli b) {
  if (b == 0)
    return {1, 0};
  auto p = euclid(b, a % b);
  return {p.s, p.f - a / b * p.s};
}
```

8.11 Chinese remainder theorem

```
pair<lli, lli> crt(pair<lli, lli> a, pair<lli, lli> b)
     {
  if (a.s < b.s)
    swap(a, b);
  auto p = euclid(a.s, b.s);
  lli g = a.s * p.f + b.s * p.s, l = a.s / g * b.s;
  if ((b.f - a.f) % g != 0)
    return {-1, -1}; // no solution
 p.f = a.f + (b.f - a.f) % b.s * p.f % b.s / g * a.s;
  return {p.f + (p.f < 0) * l, l};
}
```

9 Math

9.1 Progressions

Arithmetic progressions

$$a_n = a_1 + (n-1) * diff$$

$$\sum_{i=1}^{n} a_i = n * \frac{a_1 + a_n}{2}$$

Geometric progressions

$$a_n = a_1 * r^{n-1}$$

$$\sum_{k=1}^{n} a_1 * r^k = a_1 * \left(\frac{r^{n+1} - 1}{r - 1}\right) : r \neq 1$$

9.2 Mod multiplication

```
lli mul(lli x, lli y, lli mod) {
  lli r = 0LL;
  for (x %= mod; y > 0; y >>= 1) {
    if (y & 1) r = (r + x) % mod;
    x = (x + x) % mod;
  }
  return r;
}
```

9.3 Fpow

```
lli fpow(lli x, lli y, lli mod) {
  lli r = 1;
  for (; y > 0; y >>= 1) {
    if (y & 1) r = mul(r, x, mod);
    x = mul(x, x, mod);
  }
  return r;
}
```

9.4 Fibonacci

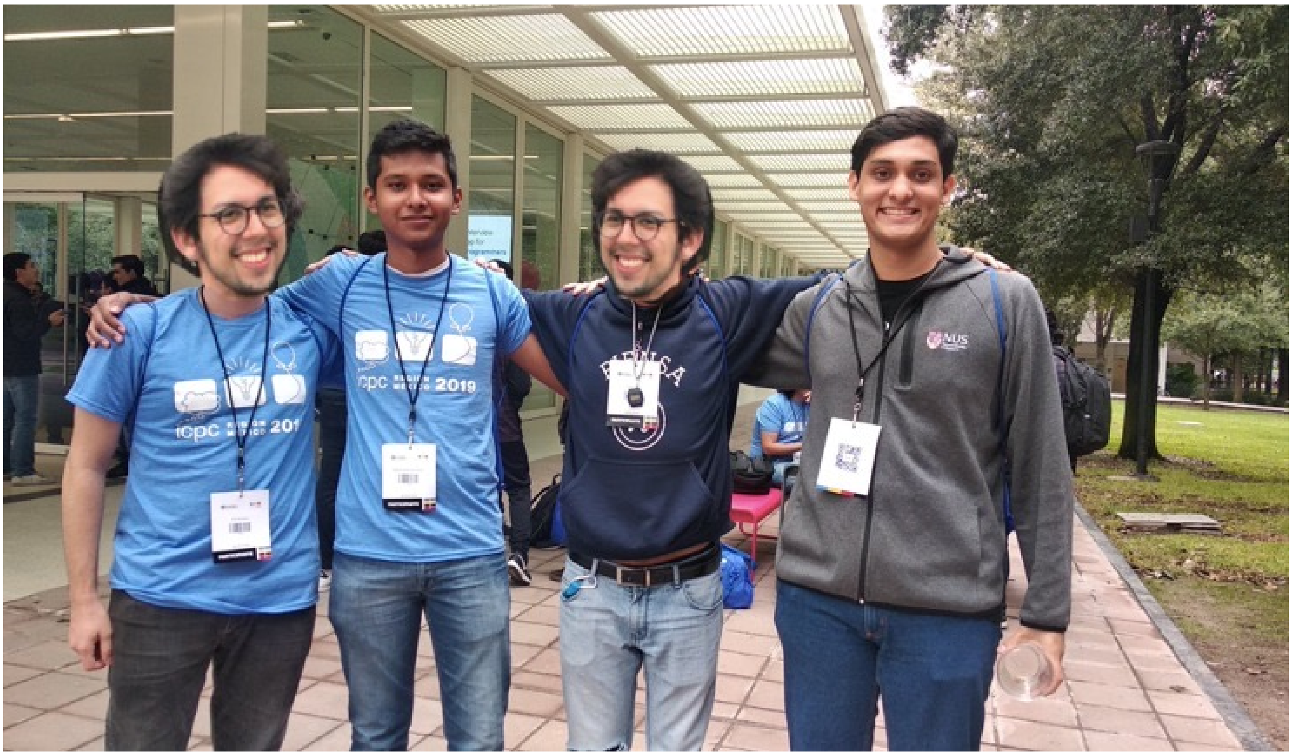
$$\begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix}^n = \begin{bmatrix} fib_{n+1} & fib_n \\ fib_n & fib_{n-1} \end{bmatrix}$$

10 Bit tricks

Bits++	
Operations on *int*	Function
`x & -x`	Least significant bit in x
`__lg(x)`	Most significant bit in x
`c = x&-x, r = x+c; (((r^x) » 2)/c) | r`	Next number after x with same number of bits set
__builtin_	Function
popcount(x)	Amount of 1's in x
clz(x)	0's to the **left** of biggest bit
ctz(x)	0's to the **right** of smallest bit

10.1 Bitset

Bitset<Size>	
Operation	Function
_Find_first()	Least significant bit
_Find_next(idx)	First set bit after index *idx*
any(), none(), all()	Just what the expression says
set(), reset(), flip()	Just what the expression says x2
to_string('.', 'A')	Print 011010 like .AA.A.



The end...
